## Logfile Analysis: Identifying a Network Attack

A backup strategy is more complex than creating a redundant copy of disk storage and considering the strategy a success. A successful backup strategy must detail how the backup media are rotated, how the media are archived, how the system will be recovered, and what the backup software will do to create the backup. Although all parts of the backup strategy are equally important, this paper will focus on the backup script and will detail a flexible backup script that uses built-in Solaris software tools which create a r...

# Logfile Analysis: Identifying a Network Attack

Michael Fleming  
February 12, 2003

## **Introduction:**

This paper presents an in-depth look into what an automated network attack looks like in the logfiles to better understand the attacks “after-the-fact”.

I will analyze two different attacks: one being easy to determine the type and the intended goal while the other attack is not so cut and dried – leaving some entertaining researching for readers. I will use two recent logfiles: June 23, 2001 and June 27, 2001 as each of these show an automated attack. I will detail what I see in the logs, attempt to determine the computer(s) involved, the operating system(s) they run, and the tool(s) that were used. I will suggest ways to prevent damage from such attacks and provide links to associated patches, if available.

## **Description:**

The organization I work for has a class B Internet IP address space with an .EDU domain name. It is my theory that our network is scanned or attacked every day, mostly just filling portions of the daily log files with “access denied” messages, however, there is always the threat of something getting through. The security game today seems to be to prevent what you know about, keep an eye out for what you don’t know yet, and when you DO know it, prevent that.

We provide email, ftp and web services to the public and to our internal corporate users while maintaining and hosting our own DNS servers. Our link to the Internet is via 100BASE-FX Ethernet to an University that has OC-3 Internet connectivity so we have a very high traffic capacity with low latency. The University blocks ICMP, the Sun RPC port 111 and the NetBIOS ports 137, 138 and 139 at their border routers. Blocking and filtering anything else is up to my organization and is handled by a border firewall device and router access lists. Contrary to my experience in “Corporate America”, the general mood here is towards University-style “open access” regarding computers and the Internet. It’s a challenging, politically-sensitive environment to secure.

Extensive logging is enabled for the firewall and all internal computers with operating systems that support central logging capabilities. Almost all routers, switches, computers and devices on the network synchronize their clocks – to within 0.10 seconds - using the sntp protocol to an internal ntp device. The internal ntp device tocks to a stratum 1 Internet ntp clock. Still, some devices do not use ntp and their clocks may differ resulting in some logfile data being more difficult to interpret.

Daily log data is divided into separate files, filtered, parsed, stripped – essentially made more human readable by various automated sed, awk and perl scripts, then archived. A

one year time frame of raw log files is maintained on-line. The “processed” log files are emailed to members of the System Admin group daily.

After reviewing the logfiles from a typical day, I’ve learned that every day leaves me with one or more of the following conclusions:

1. There was no attempted penetration of our network,
2. There was a successful penetration of our network and it affected one or more areas or machines,
3. There was a successful attack, however, we don’t have any evidence to show it – so we don’t know about it [yet].

For both attacks documented here I performed reconnaissance scans back to the indicated source IP using SuperScan<sup>1</sup>. Both of these reconnaissance scans showed poor security configurations on the attacking computers. The SuperScan scans were performed within 24 hours of each attack. In less than 24 hours after the attacks, each respective computer was off the air and one of them remained off the air up to the submission of this paper. Hmmm...

I suspect either the owners noticed something was amiss, assuming these attacking computers were compromised machines, or the ISPs received enough complaints to notify the owners or shutdown the service. This is a good thing (ISPs responding to complaints quickly), however, it doesn’t stop the attacks – it just gives us a short break before the next round of incoming and allows some time to build up our defenses. The next attack will probably come from a different IP address as there appears to be no shortage of vulnerable Internet hosts from which to stage an attack.

Well, OK then. On to the fun part.

NOTE: Packets sent to IP addresses/ports blocked by the firewall do not have any packets returned to the source – the attacker does not get any reply.

### **Attack A:**

The first logfile to examine is dated 06/24/2001 and was closed at 0300. The previous 24 hours are stored there and all of the examined attack traffic occurred on 06/23/2001. All times are MST.

This attack performed a quick, broad coverage of most of the class B address range starting at a.b.0.3 and ending at a.b.255.106 (see Appendix B), increasing the IP address in steps of between 540 and 560 (decimal).

---

<sup>1</sup> SuperScan from Foundstone:

<http://www.foundstone.com/rdlabs/tools.php?category=Scanner>

Referring to Table 1, a closer look shows the first scan occurred at 22:57:36 Hrs. and the last one was recorded at 23:30:12 Hrs. The following table shows connection attempts by protocol (sorted by time of access):

Port:	Tries	Denied by FW	Time Start	Time End	Time Total	Silence
tcp port 23	177	114	06/23 22:57:36	06/23 22:59:34	0:01:58	0:02:25
tcp Port 53	110	110	06/23 23:01:59	06/23 23:03:50	0:01:51	0:08:27
tcp port 21	278	116	06/23 23:12:17	06/23 23:30:17	0:18:00	---
Total	565	340	---	---	0:32:41	---

**Table 1**

Telnet (tcp port 23) was the first protocol scanned and lasted for just shy of 2 minutes while scanning 177 addresses with 114 attempts denied by the firewall. Approximately one and a half minutes later DNS (tcp port 53) was scanned, covering 110 addresses, all blocked, in just under 2 minutes. Lastly, 278 addresses were scanned for ftp services (tcp port 21) starting approximately 8 minutes after the DNS scan stopped where only 116 attempts were blocked at the firewall (only 42% of the attempts were blocked!!). The ftp scan lasted for 18 minutes. The denied tcp port 21 and 23 connection attempts are well documented by the firewall software whereas the connections allowed by the firewall are reported by the individual computer(s) where the connection(s) actually went, leaving it up to the various operating systems to report the connections via syslog.

I suspect the addresses used in the telnet and DNS scans were pre-programmed before the attack was started since 145 seconds isn't much time to interpret the data. However, it is possible that the results from the telnet and DNS scans were digested before the ftp scan started.

Where did the attack come from and why was it attacking (other than the obvious "The Internet" and "Because my servers were connected and running.")? **nslookup** identified the source IP as coming from a computer in Hong Kong:

```
ip-46-74-y-x.rev.<source>.com = x.y.74.46
Netname: APNIC-CIDR-BLK
Netblock: x.y.0.0 - x.y.255.255
Maintainer: AP
Kowloon, Hong Kong.
```

I was lucky enough to get a SuperScan report showing the following ports and header banners on 06/24/2001 at approximately 1615 Hrs MST as shown:

```
* + x.y.74.46
|____ 21 File Transfer Protocol [Control]
```

```

|_____ 23  Telnet
|_____ 79  Finger
|_____ 80  World Wide Web HTTP
|_____ |_____ HTTP/1.1 403 Forbidden..Date: Sun, 24

```

My impression is that this is a RedHat Linux box running ftp, telnet, and rlogin daemons, a web server, and perhaps a Samba server. I was curious about the high ports responding : 20002-20007 and 30002-30007. The limited data I found for common Trojan usage of those ports in a SANS document<sup>2</sup> shows port 20002 as possibly related to **AcidkoR** and 30003 as possibly related to **Lamers Death**. Other search data revealed the same port/Trojan assignments with nothing commonly listed for the other ports in the ranges of 20002-20007 and 30002-30007. Of course most of the tools I have in my personal arsenal, and others I've read about, allow manual port assignments, so port numbers aren't always a sure sign. Perhaps it's a new program or Trojan that's not been documented yet.

Internet search data<sup>3</sup> shows **AcidkoR** is a Win9x/NT Trojan which would agree with port 139 being listed above, however it is unlikely that a Windows box would be running finger and a RedHat version of Apache. **Lamers Death** is a remote access program for Windows that is rumored to have been written in Russia<sup>4</sup>. Neither of these programs normally uses the other listening ports in the 20002-20007 & 30002-30007 range. Perhaps the attacker was clever enough to run extraneous services and change the service headers.

<sup>2</sup> Intrusion Detection FAQ : <http://www.sans.org/newlook/resources/IDFAQ/oddports.htm>

<sup>4</sup> [http://www.simovits.com/trojans/tr\\_data/y718.html](http://www.simovits.com/trojans/tr_data/y718.html)

## **Impression:**

Inconclusive, more data is needed.

Let's now examine the packets that were rejected by the firewall. Then, we will examine packets allowed inside by the firewall and see how the individual computers responded to the connection attempts.

Appendix A shows the complete 06/23/2001 attack, sorted by time. Looking at the port, and IP addresses [sorted by time] we see a programmatic increase in IP address of the destination address for each packet between 540 and 560, decimal. The starting address for all three port scans was a.b.0.3.

A snippet of Appendix A as an example:

	Address	Delta
		Decimal
denied tcp x.y.74.46(23) -> a.b.32.79(23)		
denied tcp x.y.74.46(23) -> a.b.34.119(23)	Increment:	556
denied tcp x.y.74.46(23) -> a.b.36.163(23)	Increment:	553
denied tcp x.y.74.46(23) -> a.b.38.204(23)	Increment:	550
denied tcp x.y.74.46(23) -> a.b.40.242(23)	Increment:	553
denied tcp x.y.74.46(23) -> a.b.43.27(23)	Increment:	553
denied tcp x.y.74.46(23) -> a.b.45.69(23)	Increment:	554
denied tcp x.y.74.46(23) -> a.b.47.112(23)	Increment:	555
denied tcp x.y.74.46(23) -> a.b.49.150(23)	Increment:	550
denied tcp x.y.74.46(23) -> a.b.51.187(23)	Increment:	549
denied tcp x.y.74.46(23) -> a.b.53.229(23)	Increment:	554

This logfile section shows a small selection of telnet connection attempts (to tcp port 23). Of interest to me is the IP address incremental steps: between 549 and 558 in the above example. The minimum/maximum step observed during the attack was between 540 and 560, decimal. Similar steps were shown in the dns and ftp sections. An automated tool performed this attack but I'm not aware of one that performs this type of address incrementing through a range of IP addresses. Perhaps a tool such as nmap<sup>5</sup> or strobe<sup>6</sup> was used with input from warscan<sup>7</sup> or a pre-defined input file of addresses to scan; however, it appears that the same input file was not used for the three different scans. My thinking is that another tool using random address selection within a specified range was utilized here. The fact that the source port always matches the destination port, for the dropped packets, indicates a custom packet crafting tool as this would not occur with normal traffic.

Appendix B shows time, port and IP address, sorted by IP address. Looking at Appendix B we see that scans for the three different ports started with IP a.b.0.3. There

<sup>5</sup> From Fyodor: <http://www.insecure.org/nmap>

<sup>6</sup> <ftp://suburbia.net/pub/strobe.tgz>

<sup>7</sup> <http://www.ussrback.com/UNIX/unixscanners.htm>

are 7 times where all three ports match the same IP address and 25 occurrences where two ports met at the same address (shown bold in Appendix B). The highest address for the tcp port 21 scan was a.b.255.106, tcp port 23 scan was a.b.255.64 and the tcp port 53 scan ended with a.b.239.161.

Appendices C & D show messages returned to syslog from each connection that was not blocked by the firewall and routers, sorted by time and node name, respectively.

There were some connections that appear to have been established and it is not clear from the limited data in the logfile whether these connections made any successful logins. Those connections that were refused, most likely, were due to TCP Wrappers configurations on the individual computers. Some telnet connection messages are shown below:

```
22:57:38 node44 in.telnetd[29410]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:38 node54 inetd[6218]: connection from
ip-46-74-y-x.rev.xyz.com, service telnetd (tcp)
22:57:38 node51 inetd[96329]: connection from
ip-46-74-y-x.rev.xyz.com, service telnetd (tcp)
22:57:38 node64 in.telnetd[26214]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:38 node9 in.telnetd[1603]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:39 node49 in.telnetd[23703]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:39 node43 in.telnetd[16378]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:35 node-a14 in.telnetd[13593]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:39 node-a1 in.telnetd[6648]: [ID 947420 daemon.warning]
refused connect from root@ip-46-74-y-x.rev.xyz.com
22:57:38 node27 in.telnetd[2166]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:38 node-a13 in.telnetd[6724]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:40 node36 in.telnetd[25133]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:36 node3 in.telnetd[16261]: refused connect from
ip-46-74-y-x.rev.xyz.com
```

There is a very similar result for ftp connections:

```
23:12:18 node4 in.ftpd[16070]: connect from
ip-46-74-y-x.rev.xyz.com
23:05:40 node50 in.ftpd[2526]: refused connect from
ip-46-74-y-x.rev.xyz.com
```

```
23:12:24 node26 in.ftpd[2567]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node33 in.ftpd[25377]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:19 node7 in.ftpd[7641]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node64 in.ftpd[26318]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node9 in.ftpd[1623]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node6 in.ftpd[5972]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node6 ftpd[5972]: FTPD: connection from
ip-46-74-y-x.rev.xyz.com at Sat Jun
23:12:18 node18 in.ftpd[9061]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:17 node68 in.ftpd[16175]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:19 node19 in.ftpd[4184]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node60 in.ftpd[1422]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:12:19 node17 in.ftpd[23810]: refused connect from
ip-46-74-y-x.rev.xyz.com
```

All of the above connections, ordered by time, appear to jump randomly from host to host. Appendix D shows connections sorted by node, where we see more than one attempted connection to almost every scanned IP address that wasn't blocked by the firewall. For instance, node14 had 4 ftp connections whereas node18 received 6 ftp and 2 telnet connections. Looking at the first four lines, we see two log messages with the same source port. Inetd catches the connection and launches tcpd (TCP Wrappers). Tcpd logs the first message (in.ftpd) then launches ftpd for the second entry (ftpd), if the connection is allowed by the TCP Wrappers configuration. It's curious that the same connection is made again about 17 minutes later. I did not notice these occurrences when viewing the scan data sorted by time of connection, so sorting by node was indeed revealing.

```
23:12:42 node14 in.ftpd[16757]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:43 node14 ftpd[16757]: connection from
ip-46-74-y-x.rev.xyz.com at Sat Jun 23
23:29:59 node14 in.ftpd[16758]: connect from
ip-46-74-y-x.rev.xyz.com
23:29:59 node14 ftpd[16758]: connection from
ip-46-74-y-x.rev.xyz.com at Sat Jun 23
23:29:49 node15 in.ftpd[2321]: refused connect from
root@ip-46-74-y-x.rev.xyz.com
```

```
23:12:28 node15 in.ftpd[2278]: refused connect from

22:57:48 node15 in.telnetd[2212]: refused connect from
root@ip-46-74-y-x.rev.xyz.com
22:57:48 node15 in.telnetd[2212]: refused connect from
root@ip-46-74-y-x.rev.xyz.com
23:29:49 node15 in.ftpd[2321]: refused connect from
root@ip-46-74-y-x.rev.xyz.com
23:12:28 node15 in.ftpd[2278]: refused connect from
root@ip-46-74-y-x.rev.xyz.com
23:12:42 node16 in.ftpd[1379]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:19 node17 in.ftpd[23810]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:29:25 node17 in.ftpd[23827]: refused connect from
ip-46-74-y-x.rev.xyz.com
22:57:42 node18 in.telnetd[8881]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:28:56 node18 in.ftpd[9072]: connect from
ip-46-74-y-x.rev.xyz.com
23:28:56 node18 in.ftpd[9071]: connect from
ip-46-74-y-x.rev.xyz.com
22:57:42 node18 in.telnetd[8882]: refused connect from
ip-46-74-y-x.rev.xyz.com
23:12:20 node18 in.ftpd[9062]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:18 node18 in.ftpd[9061]: connect from
ip-46-74-y-x.rev.xyz.com
23:12:17 node18 in.ftpd[9060]: connect from
ip-46-74-y-x.rev.xyz.com
23:28:26 node18 in.ftpd[9069]: connect from
ip-46-74-y-x.rev.xyz.com
```

To better understand the log messages, I made telnet and ftp connections, intentionally failing the logins, to node14 and then observed the log messages. There are login failure messages for telnet, but not for ftp. This particular machine is running SunOS 4.1.4.

```
Jul 17 09:11:36 node14 in.telnetd[936]: connect from testhound
Jul 17 09:16:01 node14 login[937]: 4 LOGIN FAILURES FROM
testhound, fleming
Jul 17 09:16:08 node14 in.ftpd[938]: connect from node14
Jul 17 09:16:08 node14 ftpd[938]: connection from testhound
at Tue Jul 17 09:16:08 2001
```

Doing a proper login via telnet produces:

```
Jul 17 09:49:04 node14 in.telnetd[966]: connect from testhound
Jul 17 09:49:09 node14 login[967]: login from testhound as
fleming
```

### **Conclusion: Attack A:**

The whole attack took only 33 minutes. This is not enough time to manually observe and respond. The address list used to scan for one service was not used as the address list for the other service scans. Until I determine what tools were used to generate the address lists, I will conclude the address lists were determined before the scanning started and different lists were used at least for the port 21 and 53 scans.

The various operating systems sent different descriptions of connections, logins, logouts, etc. which is initially confusing so a learning phase is required. There is no definite evidence in the logs that any of these connections resulted in a successful login or account compromise, however, there is no definite evidence otherwise. It appears that only the connections were made to the services and that logins weren't attempted as there are not any "LOGIN FAILED" messages associated with that source IP address in the logfile.

This type of attack speaks directly to "defense in depth", a major theme in the SANS curriculum:

- Stop the traffic you do not want inside your network at the border firewall and/or router(s),
- For traffic that is allowed, limit the allowed source addresses with TCP Wrappers at each computer,
- Use strong passwords to make password guessing difficult, and
- Keep the operating system patches up to date.

Oh yeah – and read the logfiles to see what is getting through, take appropriate action and keep records of all actions.

### **Follow-up on Attack A:**

The attacking machine was removed from the Internet shortly after I discovered it and, I would conclude, it must have been scanning and/or attacking other sites as well. My guess would be that the ISP notified the owner(s) of the complaints and the owner(s) took action. Since then it appears to have been rebuilt with new or different services installed and looks more secured as shown by a follow-up SuperScan report on 07/15/2001, where it's running a different configuration of web server and now sendmail. Ports for FTP, telnet, finger, auth, rlogin, etc. are not responding. Another happy ending!

```

## **Attack B:**

The second attack occurred on 06/27/2001 and appears to be a Sun Solaris box hunting for IIS web servers. There were slightly less than 3000 logfile entries, in just over 2 hours, coming from a computer in the USA scanning my network to tcp port 80. According to nslookup, the source IP address is registered to another University, which means it also has a high-bandwidth, low latency Internet connection!

This attack is commonly known as the sadmind/IIS worm<sup>8</sup>. AKA Backdoor.Sadmind (NAV) , Sadmin-iis (Panda), Solaris/Sadmind.worm, and Unix/Sadmind (Sophos) according to McAfee<sup>9</sup>; AKA sadmind/IIS, and Backdoor.Sadmind.dr according to Symantec<sup>10</sup>.

A SuperScan reconnaissance scan (rapidly becoming my favorite recon tool!) back to the source IP address showed some evidence that it was a Solaris 7 box with many default services running:

My research shows that port 600 is a useful identifier of the Solaris/sadmind.worm: "The Solaris/sadmind.worm places a rootshell listening on TCP port 600 using /dev/cuc/nc."<sup>8</sup> The compromised server appears to have randomly selected a Class B network (mine!) and then proceeded to scan that address range for Microsoft IIS servers – looking for the IIS Directory Traversal/Unicode vulnerability<sup>11, 12</sup> according to the sadmind/IIS.worm MO.

My organization operates some internal IIS4 & IIS5 servers running, however, to the best of my knowledge these servers are not accessible from the Internet. It's been a constant process to keep IIS servers patched as the vulnerability list increases almost daily<sup>13</sup>. (Note to self: Scan monthly for internal IIS servers and keep patch levels up to date.)

I wonder how much time it will take for someone to modify this worm to use the double-decode vulnerability in IIS servers<sup>14, 15</sup> and then see that mod in the wild? Most of the

<sup>12</sup> Microsoft Security Bulletin (MS00-078):

<http://www.microsoft.com/technet/treeview/default.asp?url=/technet/security/bulletin/MS00-078.asp>

<sup>13</sup> SANS Windows Security Digest Vol. 4 Num. 6.

<sup>14</sup> IIS decodes filenames superfluously after applying security checks:

<http://www.kb.cert.org/vuls/id/789543>

files are easily located on the Internet, are quite easy to modify, and there seems to be no lack of vulnerable servers to host an attack.

Some logfile sections showing the incrementing of the addresses:

```
denied tcp r.s.236.88(33734) -> a.b.0.1(80), 1 packet
denied tcp r.s.236.88(33736) -> a.b.0.3(80), 1 packet
denied tcp r.s.236.88(34186) -> a.b.0.51(80), 1 packet
denied tcp r.s.236.88(34186) -> a.b.0.51(80), 1 packet
denied tcp r.s.236.88(34251) -> a.b.0.78(80), 1 packet
denied tcp r.s.236.88(34246) -> a.b.0.73(80), 1 packet
denied tcp r.s.236.88(34704) -> a.b.0.101(80), 1 packet
denied tcp r.s.236.88(34707) -> a.b.0.104(80), 1 packet
denied tcp r.s.236.88(35258) -> a.b.0.151(80), 1 packet
denied tcp r.s.236.88(35260) -> a.b.0.153(80), 1 packet
```

The above logfile snippets are but a very small section of the total scan. Most of the entire class B network range was scanned, increasing the IP address between 0 and 50, decimal. From the data I've read, this worm randomly selects the class B network to scan and then randomly increments the IP address to scan. The logfile entries are attached as Appendix E. (NOTE: Appendix E is slightly over 100 pages!!)

The scan started on Jun 27 04:35:02 and ended on Jun 27 06:37:58, which is slightly over 2 hours and, in total, there were 2838 connections denied by the firewall. Connection attempts were only made to tcp port 80, which agrees with searching for IIS servers. There were no scans to port 111 from that source IP address so it appears to have not selected my network to scan for vulnerable Solaris boxes.

### **Conclusion: Attack B:**

This was a sadmind/IIS.worm attack originating from a poorly secured Solaris 7 machine at a location where abundant Internet bandwidth existed. All of the logfile and SuperScan data support this. This is a well known common attack and proves that at least some computers still aren't properly patched or secured to prevent it. This particular computer was removed from the Internet shortly after the attack, most likely indicating many complaints (including one from myself). As of the writing of this paper, that IP address still does not respond.

The current (as of this writing - as it's always a moving target) Microsoft IIS4, IIS5 and SunOS patches for this attack can be located at the following links (watch for URL links that wrap):

## **Summary:**

This paper looked at two different logfiles, attempted to determine if an attack occurred, to identify the type and methodology of attack, and note if the type of attack was well known in the wild.

It's very important to review the logfile data daily and act quickly. In both of these attacks, the attacking computers were available – in their attacking configuration – for less than 24 hours after the attack was executed. If we're going to investigate, collect data and analyze attacks, then we need to move quickly.

There is a tremendous amount of work involved in analyzing logfile data – it must be automated as it is overwhelming for a human to do manually. The data needs to be sorted by source IP, destination IP, service and time – at a minimum – and, most importantly, someone needs to read it.

An ideal tool would be an easily configurable Intrusion Detection System (IDS) that would detect the failed (denied) attempts, then proactively – in near-real-time – deny all related traffic. However, false positives would have serious political repercussions in an

educational/research environment such as this one. The next best thing would be an IDS that doesn't act – just logs, compiles, sorts, sifts, evaluates and recommends. And, naturally, a human with time to read the data output and act accordingly.

# Upcoming SANS Training

[Click Here for a full list of all Upcoming SANS Events by Location](#)

SANS Seattle 2013	Seattle, WAUS	Oct 07, 2013 - Oct 14, 2013	Live Event
SANS Baltimore 2013	Baltimore, MDUS	Oct 14, 2013 - Oct 19, 2013	Live Event
SEC760 Advanced Exploit Development for Penetration Testers	Baltimore, MDUS	Oct 14, 2013 - Oct 19, 2013	Live Event
SANS Bangalore 2013	Bangalore, IN	Oct 14, 2013 - Oct 26, 2013	Live Event
GridSecCon 2013	Jacksonville, FLUS	Oct 15, 2013 - Oct 17, 2013	Live Event
Healthcare Cyber Security Summit	San Francisco, CAUS	Oct 17, 2013 - Oct 24, 2013	Live Event
Securing the Internet of Things Summit	San Francisco, CAUS	Oct 17, 2013 - Oct 22, 2013	Live Event
SANS Tokyo Autumn 2013	Tokyo, JP	Oct 21, 2013 - Oct 26, 2013	Live Event
ICS410	Sterling, VAUS	Oct 21, 2013 - Oct 25, 2013	Live Event
October Singapore 2013	Singapore, SG	Oct 21, 2013 - Nov 02, 2013	Live Event
SANS Dubai 2013	Dubai, AE	Oct 26, 2013 - Nov 07, 2013	Live Event
FOR572 Advanced Network Forensics and Analysis	Washington, DCUS	Oct 28, 2013 - Nov 02, 2013	Live Event
SANS Chicago 2013	Chicago, ILUS	Oct 28, 2013 - Nov 02, 2013	Live Event
MGT415 at (ISC)2 SecureSoCal 2013	Manhattan Beach, CAUS	Oct 31, 2013 - Oct 31, 2013	Live Event
SANS South Florida 2013	Fort Lauderdale, FLUS	Nov 04, 2013 - Nov 09, 2013	Live Event
SANS DHS Continuous Diagnostics & Mitigation Award (CDM) Workshop	Washington, DCUS	Nov 06, 2013 - Nov 06, 2013	Live Event
MGT415 at (ISC)2 SecureDallas 2013	Dallas, TXUS	Nov 06, 2013 - Nov 06, 2013	Live Event
SANS Pen Test Hackfest Training Event and Summit	Washington, DCUS	Nov 07, 2013 - Nov 14, 2013	Live Event
SANS Sydney 2013	Sydney, AU	Nov 11, 2013 - Nov 23, 2013	Live Event
SANS Korea 2013	Seoul, KR	Nov 11, 2013 - Nov 23, 2013	Live Event
Cloud Security @ CLOUD Expo Asia	Singapore, SG	Nov 13, 2013 - Nov 15, 2013	Live Event
SANS London 2013	London, GB	Nov 16, 2013 - Nov 25, 2013	Live Event
SANS San Diego 2013	San Diego, CAUS	Nov 18, 2013 - Nov 23, 2013	Live Event
FOR585 Adv Mobile Device Forensics	Vienna, VAUS	Nov 18, 2013 - Nov 23, 2013	Live Event
Asia Pacific ICS Security Summit & Training	Singapore, SG	Dec 02, 2013 - Dec 08, 2013	Live Event
SANS San Antonio 2013	San Antonio, TXUS	Dec 03, 2013 - Dec 08, 2013	Live Event
SANS Cyber Defense Initiative 2013	Washington, DCUS	Dec 12, 2013 - Dec 19, 2013	Live Event
SANS Oman 2013	Muscat, OM	Dec 14, 2013 - Dec 19, 2013	Live Event
