Abstract

2015 has proven to be a battleground for the endpoint. According to a report released by the Ponemon Institute, the endpoint is becoming an increasing target for attacks. Because GIAC utilizes some of the latest enterprise technology, it is no surprise that GIAC is also facing the risks outlined by the Ponemon Institute. Keeping with the organization’s upgrade cycle, Windows 10 is being considered as the next upgrade from the current Windows 7 environment. A recent pilot of Windows 10 has raised a significant number of privacy concerns for the entire organization. After conducting an assessment of the network traffic originating from Windows 10, it is evident that the default configuration will not provide an adequate level of security and privacy for GIAC Enterprises. By conducting a basic risk assessment, the Security Team has been able to analyze the risks the organization faces from an endpoint perspective, to effectively recommend a plan to secure the GIAC Enterprise system.
1. Introduction

2015 has proven to be a battleground for the endpoint. According to a report released by the Ponemon Institute, the endpoint is becoming an increasing target for attacks. Furthermore, the report highlights that the "primary reason for the difficulty in managing endpoint risk is negligent or careless employees who do not comply with security policies" (2015 State of the Endpoint Report, 2015). Because GIAC utilizes some of the latest enterprise technology, it is no surprise that GIAC is also facing the risks outlined by the Ponemon institute. Keeping with the organization’s upgrade cycle, Windows 10 is being considered as the next upgrade from the current Windows 7 environment. A recent pilot of Windows 10 has raised a significant concern for the entire organization. After conducting an assessment of the network traffic originating from Windows 10, it is evident that the default configuration will not provide an adequate level of security and privacy for GIAC Enterprises. Direct traffic analysis has proven that the amount of outbound connections should be limited to only what is required to minimize the impacts to employee private data and system usage. By conducting a basic risk assessment, the Security Team has been able to analyze the risks the organization faces from an endpoint perspective, to effectively recommend a plan to secure the GIAC Enterprise system.

2. Threat and Risk Models

2.1 Overall Method

In order to effectively identify potential solutions to mitigate the vulnerabilities presented by potential information leakage, the GIAC Security Team conducted an evaluation of the possible threats to the enterprise and then completed a risk assessment based on the identified threats and vulnerabilities. The results of the risk assessment were used to identify and prioritize potential solutions for the project tasking.
2.2 Summary of Threats

This section describes the threats and attack techniques that could be leverage against the new Windows 10 operating system.

- Information disclosure
- Unauthorized access due to stolen credentials
- Unauthorized Access from unmanaged endpoint
- Malware attack not prevented by GIAC perimeter
- Endpoint compromise may go undetected
- Information Disclosure due to data exfiltration
- Lack of user awareness decreases the ability for users to operate their systems in a secure manner.

The threats identified (also see Appendix A) were used in risk assessment to prioritize the risks and create mitigation plan accordingly.

2.3 Summary of Risks

The Security Team at GIAC Enterprises conducted a Risk Assessment, centered around the new Windows 10 deployment. It is important to note that due to time constraints, the assessment focuses on the top six risks faced by the organization. As a framework, the Center for Internet Security (CIS) Critical Security Controls (CSC) for Effective Cyber defense (CIS Controls, 2015) were used in conjunction with the aforementioned threat model. The top six risks faced by GIAC Enterprises are as follows (in greatest to least):

- CSC 17: Security Skills Assessment and Appropriate Training to Fill Gaps
- CSC 9: Limitation and Control of Network Ports, Protocols, and Services
- CSC 6: Maintenance, Monitoring, and Analysis of Audit Logs
- CSC 8: Malware Defenses
- CSC 7: Email and Web Browser Protections

The risk register as completed by the Security Team was leveraged to assist in selecting viable administrative and technical solutions to address the security and privacy
issues. The impact and likelihood of each particular item was based off of an internal review and interviews with key GIAC Enterprises personnel. The complete risk assessment with definitions can be found in Appendix B.

3. Lab Methodology

3.1 Setup

In order to support consistent, repeatable results throughout the project, virtual machines were used for the Windows 10 host and the platform for packet capture of network traffic destined for the Internet. The Windows 10 virtual machine was downloaded from the Microsoft Development website, allowing each of the testers to begin from an identical base image (Virtual Machine(VM), Windows, Virtual PC & BrowserStack: Microsoft Edge Dev, 2015). The use of virtual machines also enabled the testers to create snapshots of the Windows 10 virtual machine as they progressed through the testing and analysis in order to return to a previous state to repeat the tests as necessary.

In order to collect the traffic leaving the Windows 10 host that is destined for the Internet a second virtual machine running VyOS was used as both a router and packet capture device. VyOS is a Linux-based network operating system that provides routing and other networking support features (VyOS, 2015). The VyOS image was configured with two network interface cards in order to provide connectivity to the Windows 10 host and the Internet. The first interface was configured as the internal interface for the Windows 10 host on a custom virtual network to ensure that the Windows 10 host is the only computer communicating the VyOS machine. The external interface of the VyOS machine was configured as a Network Address Translation (NAT) interface in order to provide Internet connectivity for the Windows 10 machine through the VyOS machine.

Traffic passing through the VyOS machine was captured via tcpdump, filtered to only capture traffic to and from the Windows 10 host. Packet captures for each of the
configurations described below were conducted using the same test script in order to provide a base of results to compare the individual traffic captures against.

### 3.2 Testing

To provide a base image from which to compare the different configurations and firewall software, the following is the install that served as the base Windows 10 install.

- The default install options were utilized, leaving all of the privacy concerns of Windows 10 enabled.
- Adobe PDF reader was installed to provide a third party application that may attempt to unknowingly communicate with servers on the Internet.
- Chrome browser was installed in order to provide an additional web browser to compare against the included Microsoft Edge browser.
- The default Microsoft Windows Firewall rules for a private network were used to simulate a workstation within the corporate environment.
- A separate User account was added to simulate a regular corporate user vice the default Administrator account included with the virtual machine.

In addition to the base install, the testing procedure was conducted against the following additional configurations in order to determine the recommended Windows 10 configuration and software installation to reduce the undesired outbound Internet traffic.

- Modifications to Windows Group Policy to eliminate privacy concerns
- Windows Secure Configuration Management templates
- Installation of Windows Firewall Notifier (https://wfn.codeplex.com)
- Installation of Windows Firewall Control (http://www.binisoft.org/wfc.php)
- Installation of Traps from Palo Alto.
The testing procedure was conducted on each of the above configurations individually in order to determine the impact of each installation and/or configuration change on the amount of undesired outbound Internet traffic from the Windows 10 host. The testing procedure described below was used to determine both the amount of outbound traffic from an idle Windows host and the amount out additional outbound traffic generated from opening a PDF document and browsing to a few chosen websites.

Testing Procedure

- Begin tcpdump packet capture on VyOS VM
- Boot Windows 10 VM
- Wait for 30 minutes
- Open a PDF document with Adobe PDF Reader
- Use the Edge browser for the following sites:
  - cnn.com
  - torproject.org
  - google.com
- Use Chrome browser for the sites above
- Shut down the Windows 10 VM
- Stop the packet capture on the VyOS VM
- Just boot VM and collect pcap for 30min

### 3.3 Analysis

After completing packet captures for each of the above configurations the captures were parsed with a Python script (full script in Appendix D) in order to quickly parse through the traffic and collect statistics of concern for comparison and solution recommendation. The script essentially parsed each packet capture file and provided a comma separated file that contains information about all outbound connections from the Windows 10 host including destination IP address, domain name, amount of traffic, and whether the traffic was TCP or UDP.
Through collection and analysis of the individual packet captures, the following results were obtained for comparison.

*Figure 1. Total outbound data summary*

*Figure 2. Unique outbound IP address*
Of note, no individual configuration or software changes resulted in a dramatic decrease in the amount of outbound traffic from the Windows 10 host. The SCM and GPO changes only impact the Microsoft specific traffic while the WFN and WFC firewall changes impact third party software. For example, when using WFN with its default installation, Google Chrome browser would not connect to the Internet as it was not specifically added to the firewall rules.

4. Recommendations

4.1 Windows Privacy

By default, Windows 10 sends an abundance of personal data to Microsoft’s servers, uses a great deal of bandwidth for Microsoft’s own purposes, and profiles your Windows usage. There are a lot of articles explaining the privacy concerns and data exposure related to Windows 10, some of them are highlighted in the references section.

Two key recommendations to protect GIAC enterprises from privacy concerns from Windows 10 are to apply group policy templates highlighted in this paper, do not create Microsoft account and use local system accounts instead.
Not using a Microsoft account will protect GIAC enterprises from many of Microsoft’s attempts to collapse the local-remote distinction in its privacy policies. Some problematic policies like WiFi-Sense and if a Microsoft account is used to login Windows 10 automatically uploads a copy of recovery key – which can be used to unlock your encrypted disk – to Microsoft’s servers, probably without your knowledge and without an option to opt-out (Intercept, 2015).

By applying the group policy templates for privacy settings regular users will not have option to change them by mistake. Microsoft will be unable to revert to the default settings with patch updates, since group policies will be reapplied every 90 minutes. Even though there are many third party privacy configuration tools like DoNotSpy, GIAC Security Team does not recommend installing those third-party solutions since some of them have adware and malware bundled with some of those third party solutions.

4.2 Third Party

Although WFN and WFC produce similar results, the increased customization options provided by WFC make it a more attractive option for protecting against potential outbound traffic from third party applications. While there are similar types of software available for purchase, the open source WFC provides sufficient initial coverage to minimize the potential exposure impact of GIAC proprietary information.

4.3 Awareness Training

Based on the risk assessment, it is clear that awareness training is needed for GIAC Enterprises. This finding aligns also with the Ponemon study that suggests “The primary reason for the difficulty in managing endpoint risk is negligent or careless employees who do not comply with security policies” (2015 State of the Endpoint Report, 2015). The lack of a formal program is the primary reason that CSC CIS 17, Security Skills Assessment and Appropriate Training to Fill Gaps is the highest risk to the organization. When surveyed, users did not understand the implications of clicking a malicious link or browsing to an untrusted site. Furthermore, the users surveyed did not
understand how to report or respond if they suspect a security incident. Awareness is the first step in securing GIAC Enterprises because it affords and equips the end-user with the ability to detect and report potential security issues.

### 4.4 Results

The previously described testing procedure was repeated with the recommended Group Policy, WFC installed and running with a Medium setting, with and without using Chrome with uBlock for web browsing.

As shown in the figures below, the recommended configuration results in a significant decrease in the overall outbound traffic and hosts contacted.

![Total Outbound Data (Bytes)](image)

*Figure 4. Total outbound data in bytes with mitigation in place.*
Outbound traffic was reduced by about 75% when using mitigating controls. This reduction was without having to purchase additional software. By leveraging GPO changes, installing open-source WFC, and utilizing an ad blocker for web browsing, GIAC Enterprises is able to achieve the desired outbound traffic results, without having to spend additional money on software.
Although the recommendations can be implemented with relative ease across the GIAC enterprise, additional capabilities such as log aggregation and other features may be desired for further protection and analysis of the effectiveness may be desired. Implementation of tools such as Splunk, Traps, or a commercial firewall application may be worth investigating via a future project.

5. Conclusion

The recent deployment of Windows 10 laptops across the GIAC enterprise has presented the team with opportunities and challenges. While the Windows operating system continues to become more secure and increasingly difficult for attackers to exploit, the operating system itself is sending more and more information out of the network than ever before. Most importantly, this data is being sent out of the network based on default installation settings within the operating system. Additionally, third party applications such as Adobe Reader and others communicate information out of the network, many times without the knowledge of the user. Finally, the amount of advertising based information, including malware delivered by ads, continues to increase and is not only a privacy concern but also a security concern.

After conducting analysis of Windows Group Policy settings, free and commercial endpoint firewall solutions, an adblocker for browsing, and log aggregation software, the project team has recommended modifications to the deployed Group Policy, the installation of Windows Firewall Control, and the use of ad blockers for web browsing activities. While the cost of the recommendations only consists of the time necessary to implement and maintain, it is estimated that the changes will result in an order of magnitude reduction in unwanted traffic leaving the network with little to no impact on user experience or functionality.

Finally, the project team sees the above recommendations as the first step to securing the Windows 10 endpoints in order to prevent sensitive company information...
from leaving the enterprise. Further research into products such as Splunk, Palo Alto Traps, and commercial endpoint firewall solutions is warranted and prudent based on the ever growing threat to company information.

A. Threat Model

GIAC Security team leverages the most applicable threat models depending upon the business solution and/or the vulnerability that is being reviewed, threat models used for Windows 10 risk assessment was STRIDE and Cyber Kill chain.

**STRIDE**

STRIDE is a system developed by Microsoft for thinking about computer security threats. It provides a mnemonic for security threats in six categories.

- Spoofing of user identity
- Tampering
- Repudiation
- Information disclosure (privacy breach or data leak)
- Denial of service (D.o.S)
- Elevation of privilege

**Cyber Kill Chain**
The essence of an intrusion is that the aggressor must develop a payload to breach a trusted boundary, establish a presence inside a trusted environment, and from that presence, take actions towards their objectives, be they moving laterally inside the environment or violating the confidentiality, integrity, or availability of a system in the environment. The intrusion kill chain is defined as reconnaissance, weaponization, delivery, exploitation, installation, command and control (C2), and actions on objectives.

**Identify threats**

This phase identifies applicable threats to the proposed Windows 10 solution. This activity takes into consideration the GIAC business context and possible threat actors who might be interested in the business solution. The diamond model of intrusion analysis is applied when applicable different threat actors.

Based on applying above threat models, the threats and attack techniques that could be leverage against the new Windows 10 operating system.

**Information disclosure**

- Unauthorized access due to stolen credentials
- Unauthorized Access from unmanaged endpoint
- Malware attack not prevented by GIAC perimeter
- Endpoint compromise may go undetected
- Information Disclosure due to data exfiltration
- Lack of user awareness decreases the ability for users to operate their systems in a secure manner.

**B. Risk Model**

The overall impact and likelihood matrix shows the level of risk when each variable is combined. These definitions were considered when conducting the interviews with GIAC Employees and through a basic security assessment of the organization.

**Likelihood**
Securing the GIAC Enterprise Endpoint

C. Tool Technical Reference

Most of the Windows 10 security recommendations are part of Windows operating system enhancements and the documentation and reference are available in Technet. Some reference articles are highlighted below:

Splunk is one of the leading SIEM solution and there are many references available on developing Splunk queries and dashboards for detecting suspicious and anomalous activities. Below webpage has some reference papers:

http://www.splunk.com/view/resources/SP-CAAAGWZ
Palo Alto Traps is advanced endpoint protection from Palo Alto networks. Below webpage has some reference papers:

https://www.paloaltonetworks.com/products/endpoint-security.html

D. Python Script for Data Analysis

The Security Team utilized a custom written Python script to rapidly and consistently analyze the packet captures. The script is as follows:

```python
#!/usr/bin/env python
import pyshark
import csv
import sys

def get_ipv4_info(cap_file, display_filter):
    cap = pyshark.FileCapture(cap_file, display_filter=display_filter,
                               keep_packets=False)

    accum = []

    def ipv4_info(pkt):
        try:
            protocol = pkt.transport_layer
            src_addr = pkt.ip.src
            src_port = pkt[protocol].srcport
```

Balakrishnan, Hosburgh, Neise
dst_addr = pkt.ip.dst
dst_port = pkt[protocol].dstport
if protocol == "TCP":
    len_payload = int(pkt[protocol].len)
elif protocol == 'UDP':
    len_payload = int(pkt[protocol].length)
entry = dict(src_ip=src_addr, src_port=src_port,
             dst_ip=dst_addr, dst_port=dst_port,
             payload=len_payload, protocol=protocol)
accum.append(entry)
except AttributeError as e:
    pass

cap.apply_on_packets(ipv4_info, timeout=10000)

return accum

def get_ipv6_info(cap_file):
    cap = pyshark.FileCapture(cap_file, keep_packets=False)
    accum = []

def ipv6_info(pkt):
    try:
        protocol = pkt.transport_layer
        src_addr = pkt.ipv6.src
        src_port = pkt[protocol].srcport
        dst_addr = pkt.ipv6.dst
        dst_port = pkt[protocol].dstport
        entry = dict(src_ip=src_addr, src_port=src_port,
                      dst_ip=dst_addr, dst_port=dst_port)
        accum.append(entry)

    except AttributeError as e:
        pass
cap.apply_on_packets(ipv6_info, timeout=100)

    return accum

def get_icmp_info(cap_file, display_filter):
    cap = pyshark.FileCapture(cap_file, display_filter=display_filter,
                               keep_packets=False)
    accum = []

def icmp_info(pkt):
    try:
        src_addr = pkt.ip.src
        dst_addr = pkt.ip.dst
        icmp_type = pkt.icmp.type
        icmp_code = pkt.icmp.code
        entry = dict(src_ip=src_addr, dst_ip=dst_addr,
                     icmp_type=icmp_type, icmp_code=icmp_code)
        accum.append(entry)
    except AttributeError as e:
        pass

cap.apply_on_packets(icmp_info, timeout=100)

    return accum

def get_dns_info(cap_file):
    cap = pyshark.FileCapture(cap_file, keep_packets=False)
    accum = {}

def dns_info(pkt):
    try:
        dns_name = pkt.dns.resp_name
        ip_addr = pkt.dns.resp_addr
        accum[ip_addr] = dns_name
    except AttributeError as e:
cap.apply_on_packets(dns_info, timeout=10000)

return accum

def main(pcap_file, source_ip):
    display_filter = 'ip.src==' + source_ip
    csv_file = pcap_file + '.csv'
    outbound_ipv4 = {}
    dns_list = get_dns_info(pcap_file)
    #icmp_list = get_icmp_info(pcap_file, display_filter)
    #ipv6_list = get_ipv6_info(pcap_file)
    ipv4_list = get_ipv4_info(pcap_file, display_filter)

    for item in ipv4_list:
        dest = item['dst_ip']

        if dest not in outbound_ipv4:
            outbound_ipv4[dest] = dict(tcp_data=0, udp_data=0, name='None')

        if item['protocol'] == 'TCP':
            outbound_ipv4[dest]['tcp_data'] += item['payload']
        elif item['protocol'] == 'UDP':
            outbound_ipv4[dest]['udp_data'] += item['payload']

        try:
            outbound_ipv4[dest]['name'] = dns_list[dest]
        except:
            pass

    with open(csv_file, 'w') as csvfile:
        csvfile.write('IP,TCP,UDP,Name
')
        for key in outbound_ipv4:
            line = ('{},{},{},{}
').format(key,

E. Microsoft SCM Security Baseline for Windows 10

The following are the steps to get the Windows 10 security baseline installed on a test workstation. To note, if deploying to an enterprise, it is most effective to import the Group Policy Objects (GPOs) into Active Directory for deployment.

**Windows 10 Security Baseline Install Steps**

1. Download baseline settings to your desktop: [http://blogs.technet.com/cfs-filesfilesystemfile.ashx/__key/telligent-evolution-components-attachments/01-4062-00-00-03-65-56-14/Win10_2D00_IE11_2D00_Baselines_2D00_DRAFT.zip](http://blogs.technet.com/cfs-filesfilesystemfile.ashx/__key/telligent-evolution-components-attachments/01-4062-00-00-03-65-56-14/Win10_2D00_IE11_2D00_Baselines_2D00_DRAFT.zip)
2. Unzip to desktop
4. Copy the setup.msi file to the extracted folder Win10-IE11-Baselines-DRAFT\Local_Script\EMET and rename the setup file to EXACTLY this: `EMET Setup.msi`
5. Right click on the 10_Client_Install.cmd and run as an admin to install the baseline settings into the local group policy.
6. Next, create a local user account. Now that the baseline is applied, you need to come up with a long and complex password (or change the setting).
7. Run → mmc
   a. add the Group Policy Object editor
   b. Set for the local machine
   c. Once added, save the .msc to your desktop as policy.msc and then close it.
   d. Right click on the policy.msc file and run as an admin
8. Now change the following two security settings:
a. in the Group Policy Object editor, expand Local Computer Policy ->
   Windows Settings -> Security Settings -> Local Policies -> Security
   Options
b. Enable Interactive logon: Do not display last user name
c. Disable Interactive logon: Do not require CTRL+ALT+ DEL

9. Finally, run -> netplwiz
   a. make sure the "Users must enter a username and password to use this
      computer" has a check mark. If not put a checkmark in the box and hit
      apply

10. Shutdown and take a snap shot.
11. When you power back on, you will have the new settings applied. Make sure you
    logon with your normal user account to perform tests/captures.
12. Additionally, you can apply more restrictive privacy policies. An explanation of
    these privacy settings can be found in Appendix E.
F. Group Policy and Privacy Settings Map

This table shows the group policy setting, its privacy implication (if known) and the loss of functionality (if known) if it is disabled.

Preinstalled apps

x

To remove the News app:

- Right-click the app in Start, and then click **Uninstall**.
- or-
- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

  ```powershell
  Get-AppxProvisionedPackage -Online | Where-Object {$_.PackageName -Like "Microsoft.BingNews"} | ForEach-Object {
    Remove-AppxProvisionedPackage -Online -PackageName $_.PackageName
  }
  -and-
  - Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

  ```powershell
  Get-AppxPackage Microsoft.BingNews | Remove-AppxPackage
  ```

To remove the Weather app:

- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

  ```powershell
  Get-AppxProvisionedPackage -Online | Where-Object {$_.PackageName -Like "Microsoft.BingWeather" Limits app specific functionality such as news feeds, weather, etc.} | ForEach-Object {
    Remove-AppxProvisionedPackage -Online -PackageName $_.PackageName
  }
  -and-
  - Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

  ```powershell
  ```
For each app:

- \textbf{Remove the app for the current user.} From an elevated command prompt, run the following Windows PowerShell command:
  
  ```powershell
  Get-AppxPackage
  Microsoft.BingWeather | Remove-AppxPackage
  ```

To remove the Money app:

- Right-click the app in Start, and then click \textbf{Uninstall}.
- \textbf{Or}:

- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:
  
  ```powershell
  Get-AppxProvisionedPackage
  -Online | Where-Object
  {$_.PackageName -Like
  "Microsoft.BingFinance"}
  | ForEach-Object {
  Remove-AppxProvisionedPackage
  -Online -PackageName
  $_.PackageName}
  ```

- \textbf{And}:

- Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:
To remove the Sports app:

- Right-click the app in Start, and then click **Uninstall**.
- -or-
- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

```powershell
Get-AppxProvisionedPackage -Online | Where-Object {$_packageName -like "Microsoft.BingSports"} |ForEach-Object {
    Remove-AppxProvisionedPackage -Online -PackageName $_packageName}
```
- -and-
- Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

```powershell
Get-AppxPackage Microsoft.BingSports |Remove-AppxPackage
```

To remove the Twitter app:

- Right-click the app in Start, and then click **Uninstall**.
- -or-
- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:
PowerShell command:

```powershell
Get-
AppxProvisionedPackage
-Online | Where-Object
{$_._PackageName -Like
"*.Twitter"} | ForEach-
Object { Remove-
AppxProvisionedPackage
-Online -PackageName
$_._PackageName}
```

- and -

- Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

```
powerShell
Get-AppxPackage
*.Twitter | Remove-
AppxPackage
```

To remove the XBOX app:

- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

```
powerShell
Get-
AppxProvisionedPackage
-Online | Where-Object
{$_._PackageName -Like
"Microsoft.XboxApp"} | ForEach-
Object { Remove-
AppxProvisionedPackage
-Online -PackageName
$_._PackageName}
```

- and -

- Remove the app for the current user. From an elevated command prompt,
run the following Windows PowerShell command:

```powershell
Get-AppxPackage
Microsoft.XboxApp | Remove-AppxPackage
```

To remove the Sway app:

- Right-click the app in Start, and then click **Uninstall**.
- **-or-**
- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

```powershell
| ForEach-Object {
Remove-AppxProvisionedPackage -Online -PackageName $_.PackageName}
```

- **-and-**
- Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

```powershell
Get-AppxPackage
Microsoft.Office.Sway | Remove-AppxPackage
```

To remove the OneNote app:

- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:
Get-AppxProvisionedPackage -Online | Where-Object {$_._.PackageName -Like "Microsoft.Office.OneNote"} | ForEach-Object {
Remove-AppxProvisionedPackage -Online -PackageName $_._.PackageName
}

- and -

Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

Get-AppxPackage Microsoft.Office.OneNote | Remove-AppxPackage

To remove the Get Office app:

- Right-click the app in Start, and then click Uninstall.
- or -
- Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

Get-AppxProvisionedPackage -Online | Where-Object {$_._.PackageName -Like "Microsoft.MicrosoftOfficeHub"} | ForEach-Object {
Remove-AppxProvisionedPackage -Online -PackageName $_._.PackageName
}

- and -
● Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

```
Get-AppxPackage
Microsoft.MicrosoftOfficeHub | Remove-AppxPackage
```

To remove the Get Skype app:

● Right-click the Sports app in Start, and then click **Uninstall**.

● -or-

● Remove the app for new user accounts. From an elevated command prompt, run the following Windows PowerShell command:

```
Get-AppxProvisionedPackage
-Onlin $._.PackageName -Like
"Microsoft.SkypeApp"
ForEach-Object {
Remove-AppxProvisionedPackage
-Onlin -PackageName
$._.PackageName
```

● -and-

● Remove the app for the current user. From an elevated command prompt, run the following Windows PowerShell command:

```
Get-AppxPackage
Microsoft.SkypeApp | Remove-AppxPackage
```

G. Windows 10 Security Features

Windows 10 is designed to protect against known and emerging security threats across the spectrum of attack vectors.

<table>
<thead>
<tr>
<th>Domain</th>
<th>Windows 10 Security Feature</th>
<th>Description of risk mitigation</th>
<th>Recommendation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity</td>
<td>Microsoft Passport</td>
<td>Microsoft Passport replaces</td>
<td>Biometric</td>
</tr>
<tr>
<td>Protection</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>------------</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td></td>
<td>passwords with strong two-factor authentication that consists of an enrolled device and a Windows Hello (biometric) or PIN.</td>
<td>authentication and enterprise grade two-factor authentication in Windows 10 will help protect GIAC business data and online experiences without the need for regularly changing passwords.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Microsoft Hello</td>
<td>Hello replaces the need for a password to log in, which is both more secure and harder to forget. A PIN is generated which is backed by your biometric information; this is more secure as these are valid only on registered device.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Microsoft Azure Active Directory</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>User Access Control (UAC)</td>
<td>User Account Control (UAC) helps prevent malware from damaging a computer and helps organizations deploy a better-managed desktop environment.</td>
<td></td>
</tr>
<tr>
<td>Data Protection</td>
<td>Bitlocker</td>
<td>BitLocker has provided encryption for full drives and portable drives; in Windows 10, BitLocker will even protect individual files, with data loss prevention capabilities.</td>
<td>BitLocker Drive Encryption is a data protection feature that integrates with the operating system and addresses the threats of data theft or exposure from lost, stolen, or inappropriately</td>
</tr>
<tr>
<td>Malware Resistance</td>
<td>Device Guard</td>
<td>Device Guard is a combination of enterprise-related hardware and software security features that, when configured together, will lock a device down so that it can only run trusted applications. If the app isn’t trusted it can’t run, period. It also means that even if an attacker manages to get control of the Windows kernel, he or she will be much less likely to be able to run malicious executable code after the computer restarts because of how decisions are made about what can run and when. Device Guard protects against APT and advanced threats.</td>
<td>Enterprise data protection - (EDP)</td>
</tr>
<tr>
<td>Windows Defender</td>
<td>Anti-malware solution</td>
<td></td>
<td></td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Microsoft Edge</strong></td>
<td>Microsoft Edge is a Universal App that does not run older binary extensions, including Microsoft Active X and Browser Helper Objects (BHO) frequently used for toolbars, thus eliminating risks related to browser add-ons. Edge uses AppContainer-based sandboxing to protect the system from vulnerabilities that may be discovered in the extensions running in the browser (for example, Adobe Flash, Java) or the browser itself.</td>
<td>Microsoft Edge has features like Smartscreen, sandboxing which protects GIAC assets from drive-by web based infections.</td>
<td></td>
</tr>
<tr>
<td><strong>Applocker</strong></td>
<td>AppLocker helps you control which apps and files users can run. These include executable files, scripts, Windows Installer files, dynamic-link libraries (DLLs), packaged apps, and packaged app installers.</td>
<td>Applocker prevents successful installation of malware and protects GIAC assets.</td>
<td></td>
</tr>
<tr>
<td><strong>Windows Firewall</strong></td>
<td>Windows Firewall blocks traffic which is not explicitly allowed</td>
<td>Windows Firewall will protect GIAC assets from unwanted network communications.</td>
<td></td>
</tr>
<tr>
<td><strong>Enhanced Mitigation Experience Toolkit (EMET)</strong></td>
<td>Enhanced Mitigation Experience Toolkit (EMET)</td>
<td>EMET will protect GIAC from</td>
<td></td>
</tr>
</tbody>
</table>
Securing the GIAC Enterprise Endpoint protects against cyberattacks, by helping detect and block exploitation techniques that are commonly used to exploit memory corruption vulnerabilities. EMET anticipates the most common actions and techniques adversaries might use in compromising a computer, and helps protect by diverting, terminating, blocking, and invalidating those actions and techniques.

<table>
<thead>
<tr>
<th>Windows Update for Business</th>
<th>Streamlining patch management process</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Local Administrator Password Solution (LAPS)</strong></td>
<td>Compromised identical local account credentials could allow elevation of privilege if an attacker uses them to elevate from a local user/administrator to a domain/enterprise administrator. Local administrator credentials are needed for occasions when logon is required without domain access. In large environments, password management can become complex, leading to poor security practices, and such environments greatly increase the risk of a Pass-the-Hash (PtH) credential replay attack.</td>
</tr>
<tr>
<td><strong>Conditional access</strong></td>
<td>The Windows Device Health Attestation cloud service used in concert with management system such as Microsoft Intune can provide Conditional access services that help prevent Conditional access help prevent untrustworthy devices from gaining access to corporate resources.</td>
</tr>
